# Diabetic Complications Study

---

## OUTCOME FOR THE ORIGINAL STUDY DESIGN

### **Cases: *DIABETIC PATIENTS EXPERIENCING COMPLICATIONS***

- first amputation in the past 12 months or foot complications
- dialysis initiated within the previous 12 months or serum creatinine levels of 3 mg/dl or more
- blindness developed within the previous 12 months or proliferative retinopathy/diabetic maculopathy

### **Controls: *DIABETIC PATIENTS WITHOUT COMPLICATIONS***

- patients without any of the previous complications

**Case - Control rate 1:2**

**Nicolucci A et al. A comprehensive assessment of the avoidability of long term complications of diabetes mellitus: a case-control study, *Diabetes Care*, 1996; 19 (9): 927-933**

# National Italian Sample

---

## *Population*

	<i>Total</i>	<i>Cases</i>	<i>Controls</i>
• <i>N (Subjects)</i>	<b>2774</b>	<b>886</b>	<b>1888</b>
<i>Type 1:</i>	<b>379</b>	<b>185</b>	<b>194</b>
<i>Type 2:</i>	<b>1390</b>	<b>212</b>	<b>1178</b>
<i>Type 2/IT:</i>	<b>1005</b>	<b>489</b>	<b>516</b>
• <i>N (Care centers)</i>			
<i>Diabetic Outpatient Clinics:</i>	<b>35</b>		
<i>General Practitioners:</i>	<b>49</b>		

# Potential Correlates

---

## *PREDICTORS*

- Age\*
- Diabetes duration\*
  
- Sex
- Occupation
- Marital status
- Hypertension
- History of myocardial infarction and/or stroke
- Co-morbidity
- Need for help to reach the health facility
- Regular attendance to visits
- Compliance with dietary recommendations
- Self-adjustment of insulin dose
- Self-monitoring
- Frequency of educational interventions
- Smoke
- Alcohol consumption in the past five years

\*global adjustment terms and tree predictors

# Identifying New Outcomes

---

## Outcome: quality of care (process)

- expressed as the rate of execution of the following procedures in the past 12 months (based on the expected number from the application of St. Vincent Decl.'s guidelines):

- *use of glycated haemoglobin*

- *monitoring of cardiovascular risk factors*  
(blood pressure, blood lipids)

- *monitoring of renal function*  
(microalbuminuria, macroalbuminuria, serum creatinine)

- *eye examination*

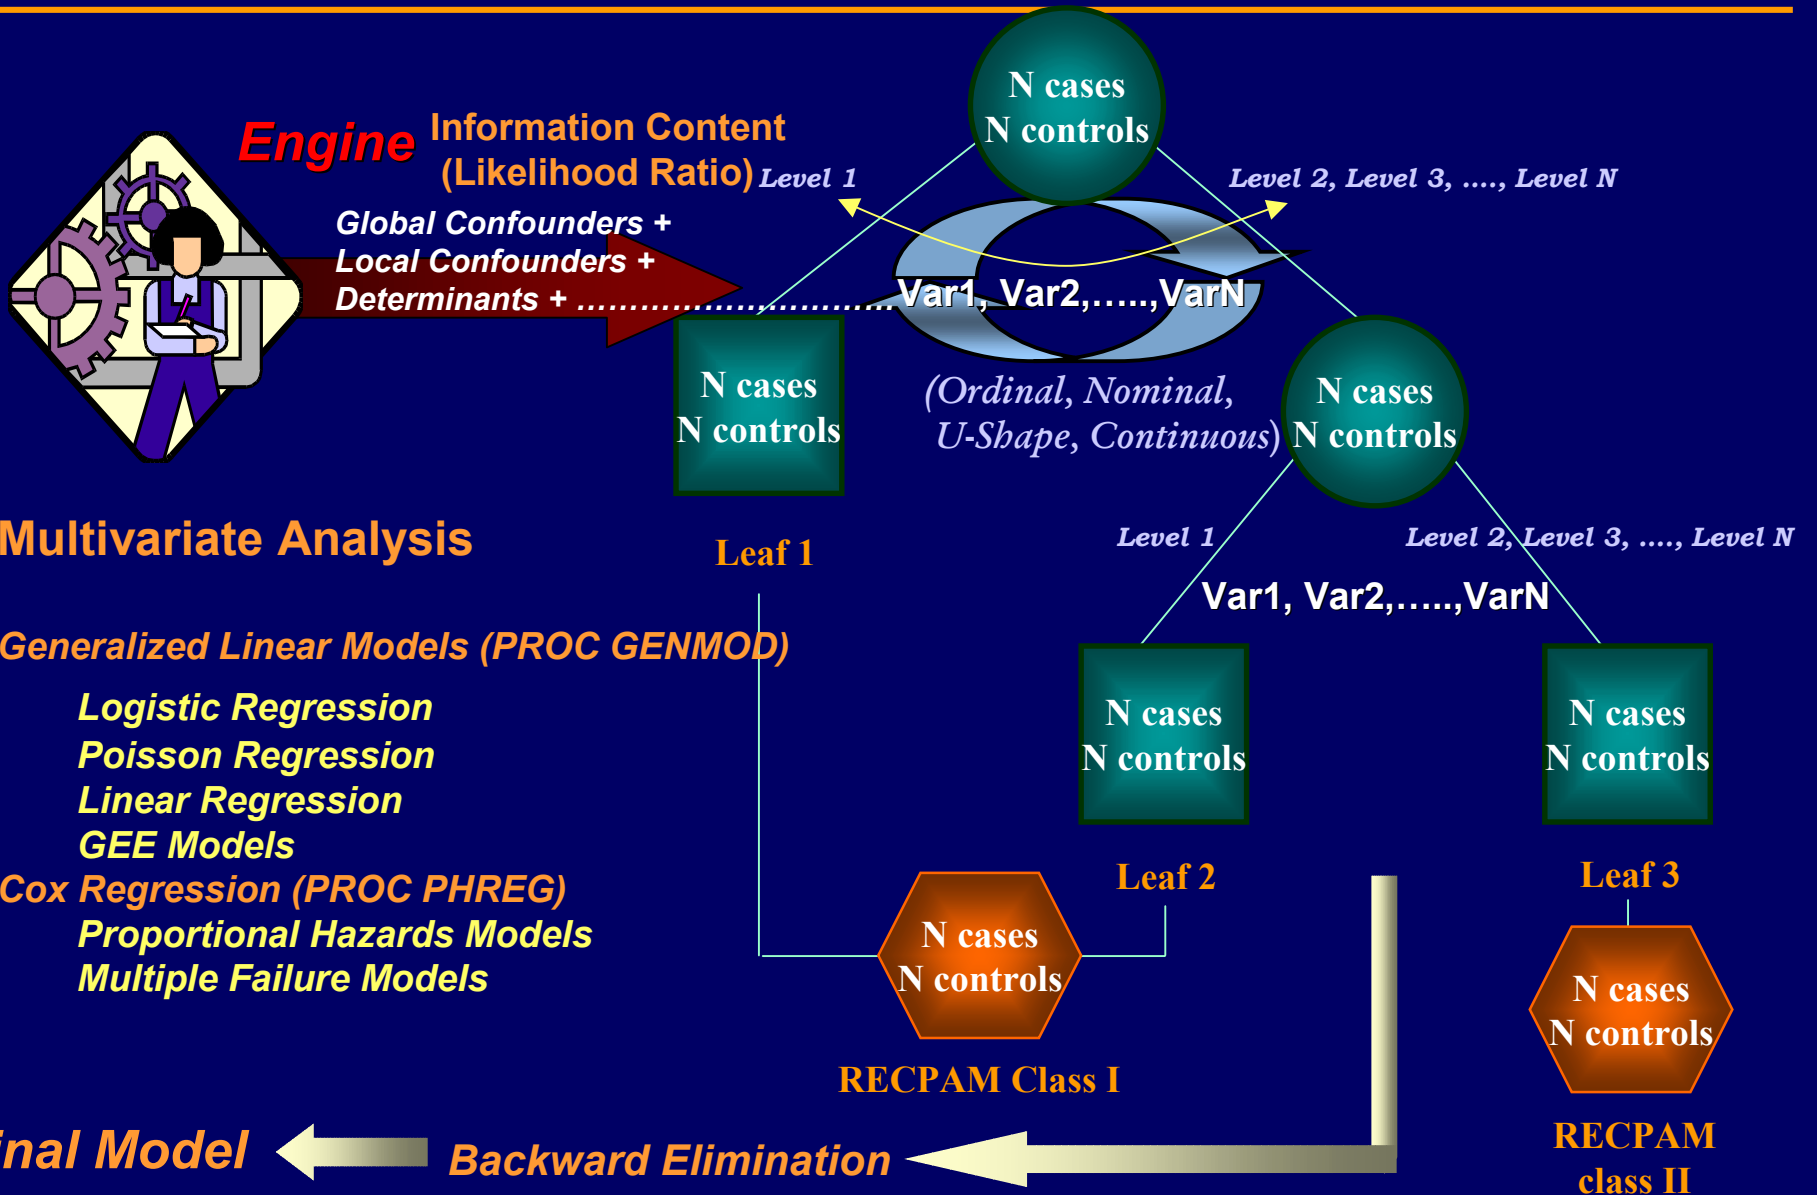

- *educational interventions on selected aspects of care*  
(diet, self-monitoring of blood glucose, insulin therapy self-management, hypoglycemic emergencies, foot care, physical activity)

- *frequency of the educational interventions*  
(regular vs. not regular)

*cut-off: 50% (lower quartile)*

<i>low quality <math>\leq 50\%</math></i>	<i>N =</i>	<i>689</i>
<i>good quality <math>&gt; 50\%</math></i>	<i>N =</i>	<i>2085</i>

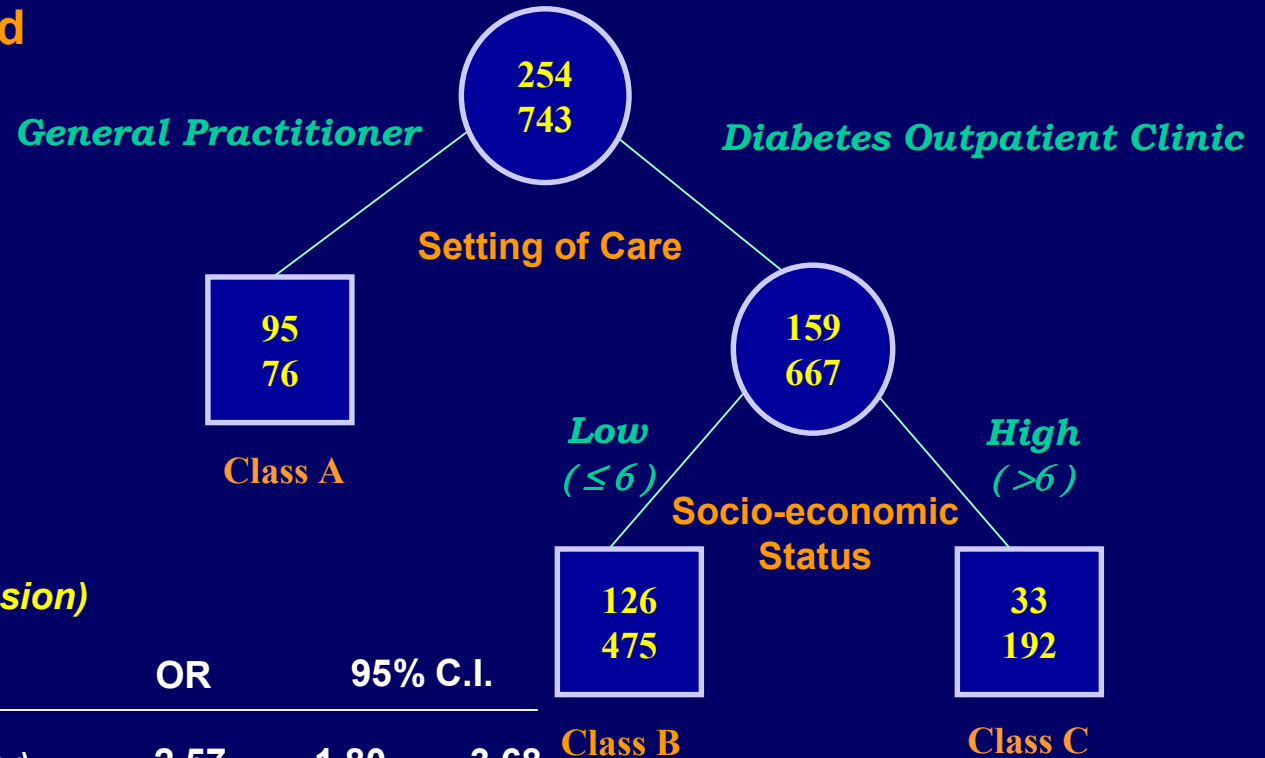

# RECPAM/SAS (F.Carinci, A.Ciampi)

# Quality-based stratification tree + statistical model

**Type 2 Insulin-Treated  
Diabetes Mellitus  
(N=997)**

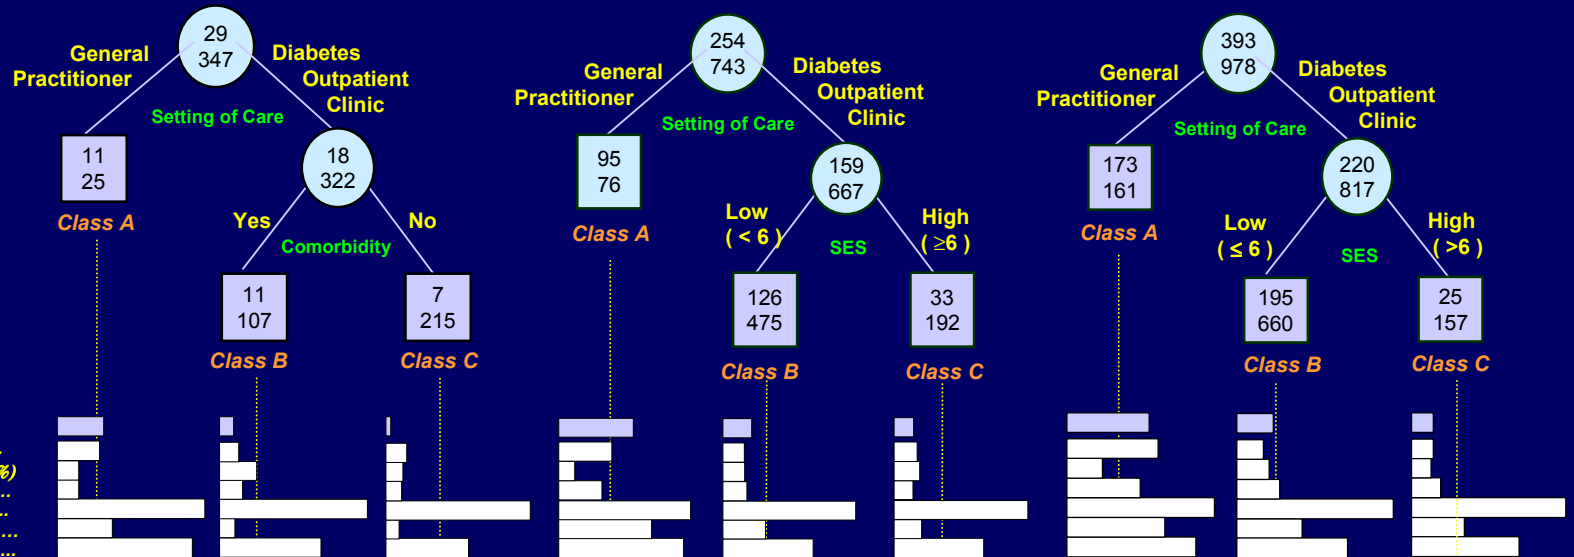

## Final Model (Logistic Regression)

Variable	OR	95% C.I.	
Not regular visits (R.C.= regular)	2.57	1.80	3.68
Age	1.01	0.99	1.02
Diabetes Duration	0.99	0.97	1.01
Cardiovascular Risk (R.C. = no)	1.49	1.02	2.17
Class A (R.C.= Class C)	5.05	3.05	8.36
Class B (R.C. = Class C)	1.59	1.04	2.45

# Disease Management Systems Analysis
